CLINIC OF ORAL SURGERY AND STOMATOLOGY

Autotransplantation of developing teeth: an interdisciplinary approach

Autotransplantation of teeth before the root is fully formed is an established treatment option for replacing missing teeth in growing individuals. Favorable orthodontic indications, good surgical access and optimal match between the donor tooth and the recipient site are prerequisites for a successful outcome. Premolars with developing roots due to their morphology and position in the dental arch are optimal donors with success reported over 90 per cent. The protocol for transplantation of developing teeth that will be presented in this course was established at the University in Oslo more than four decades ago and since then it has been successfully applied in the everyday clinical practice in many countries.

Topics

- Autotransplantation of immature teeth – surgical protocol for premolar agenesis and the missing teeth in the anterior maxilla
- Orthodontic treatment planning in patients with premolar agenesis and traumatic teeth injuries
- Healing, follow-up protocol and orthodontic treatment of autotransplanted teeth
- Status of the alveolar process in relation to the autotransplantation of developing teeth (including different types of teeth)

Invited speakers

Invited speakers

Prof. Dr. Ewa Czochorowska
Department of Orthodontics,
Medical University of Warsaw, Poland

Prof. Dr. Pawel Plakwicz
Department of Periodontology,
Medical University of Warsaw, Poland /
University of North Carolina, Chapel Hill, USA

Organization

(Registration and information)

Mrs. P. Lauber
